SUMMARY

Full-stack engineer who ships production systems end to end — Python serverless backends, React and TypeScript front ends, and the cloud infrastructure underneath. Built two production platforms at a managed IT provider and an entire nine-system software stack for a retail business, owning each from first requirement to live deployment.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL

Front End: React 19, Next.js, Vite, Tailwind, HTML, CSS, responsive and real-time UI

Back End: Node.js, Express, Azure Functions (Python), Firebase Cloud Functions, REST API design, OAuth 2.0

Cloud & Data: Azure (Static Web Apps, Functions, Blob & Table Storage, Key Vault, App Insights), Firebase, Firestore, Azure SQL, MongoDB

Practices & Tooling: Azure DevOps CI/CD, Git, pytest, Stripe, Google Vision OCR, Azure OpenAI, Agile

PROFESSIONAL EXPERIENCE

E3 IT Services — Azure DevOps Engineer

2024 – Present · Managed IT services provider

Call Automation Platform & Operations Dashboard

- Built a React 19 + TypeScript + Vite operations dashboard on Azure Static Web Apps over a Node.js API — live service health, storage analytics, and a searchable recording and transcript explorer filterable by date, engineer, and correlation ID. Added HTTP Range handling so engineers can scrub call audio in the browser, plus Azure Cost Management integration for per-call spend. All credentials stay server-side.
- Architected the underlying platform across three Python Azure Function Apps: answers inbound Azure Communication Services calls, routes through an ordered Microsoft Teams engineer queue with voicemail failover, transcribes with Azure Speech, and generates client-ready ticket documentation with Azure OpenAI posted straight into Autotask.
- Designed table-backed idempotency and end-to-end correlation tracing so duplicate webhooks and retries cannot create duplicate recordings, analyses, or ticket notes — and any call is traceable across every service from one query.

Unified Network Monitor

- Built a single-page console unifying UniFi, SonicWall, and Cisco Meraki fleets — KPI rollups, per-vendor tables, active alerts, CVE advisories, drill-down drawers, search, sorting, and incremental loading — over a Python Azure Functions backend that polls vendor APIs every five minutes, normalizes multi-vendor data into snapshots, and reconciles issues into Autotask tickets through a Table Storage state machine.

P&S Ravioli Company — Full Stack Developer (Freelance)

2024

- Built a real-time Firestore inventory platform with auto-generated UPC barcodes, multi-location stock tracking, and role-based dashboards for drivers and managers with search, live analytics, and automated PDF reporting — cutting lookup time by roughly 50%.

Dolce Vita Gelato — Full Stack Developer

2023 – 2024 · Live: gelato-system-demo.web.app · dolcevitasewell-mobileorder.com

- Designed, built, and maintained an entire company software stack — nine integrated systems spanning mobile ordering, self-order kiosk, digital signage, order management, inventory, recipe R&D, and staff tooling — all sharing one real-time Firebase backend, so a change in one place updates everywhere instantly.
- Built the customer mobile ordering app — animated themed UI, full cart and Stripe checkout, and GPS geofenced check-in that pings staff the moment a customer reaches the pickup zone.
- Built the digital signage and product management platform — in-store displays sync menu, pricing, and promos from Firebase with looping video and seasonal layouts, while the admin side controls active flavors, sold-out toggles, and daily specials, pushed live to every screen instantly.
- Built the self-order kiosk and staff Order Manager, pulling mobile, kiosk, and walk-in orders into one real-time Firestore queue with automatic geofenced arrival alerts.
- Built a React + TypeScript recipe lab (Vite, Tailwind, Firestore) replacing the manual recipe workbook with automated ingredient scaling, plus a multi-module inventory platform and role-gated staff portal on Firebase Auth.

SELECTED PROJECTS

- Insurance Estimate AI Comparison Platform** — Secure React + Firebase platform for a public adjusting firm. Adjusters upload carrier estimate PDFs; Cloud Functions run Google Vision OCR and Gemini generates side-by-side discrepancy reports surfacing underpaid line items, exportable to PDF or Excel — turning hours of manual line-by-line comparison into seconds. Per-user isolation via Firebase security rules.
- Interactive 3D Solar System** (solar.dantecorso.com) — Real-time WebGL scene built from scratch with Three.js — orbital motion and free-fly camera at 60fps.

EDUCATION & CERTIFICATIONS

B.S. Computer Science, Networking Systems Concentration — Rowan University, May 2024

A.S. Computer Science — Rowan College of South Jersey, 2022
